South Dakota Governor's Homes

Jeff Birkeland
CEO

Happy New Year, everyone! May this article find you and your family in good health...and may we have abundant moisture in 2025 so the crops and land thrive.

This month, I'd like to change things up a little bit and report on something affecting all our communities: housing. I had the opportunity to attend an economic development meeting, where the main topic was housing. I did a lot of listening and thinking during and after that meeting, and one thing stood out to me. It appears to me that the most cost-effective way for us to get affordable new homes in our communities is to take a serious look at the South Dakota Governor's Homes. I'll run through the costs and eligibility requirements, and then you can make your own decision.

COST

South Dakota Governor's Homes are constructed in two and three-bedroom options. The two-bedroom home is 1,008 square feet and costs \$75,900. The three-bedroom home is 1,200 square feet and costs \$89,900 (those are delivered prices). It also comes with a furnace, air conditioning system, and hot water heater. Here is a list of items not included in that price, which will add to the total cost.

1. Lot and or land
2. Crawl space or basement
3. Deck
4. Garage
5. Floor coverings
6. Household appliances.

I think we can all agree that the price of these homes with a heating and cooling system is hard to beat. The downside is that the house is not built with local materials and labor, but the foundation/ basement, deck and garage would all be built using local businesses, so that helps.

WHO QUALIFIES

Unfortunately, not everyone qualifies for these homes. In order to qualify, a purchaser must:

1. Make \$66,570 or less in a one or two-person household or \$76,080 or less in a household of three or more.
2. Have a net worth of less than \$125,000 or \$105,000 in liquid assets for applicants age 61 or younger.
3. Have a net worth of less than \$250,000 or \$140,000 in liquid assets for applicants age 62 or older.
4. Consider the home their only residence.
5. Place the home within South Dakota.

Here is another interesting aspect of the program. A purchaser must live in the home for three years; after that time, they can sell it for market value. So, an argument can be made that this is also an investment opportunity for someone. There is also a two-year waiting list for a home to be built.

More information and floor plans can be found at <https://www.sdhousing.org/ready-to-buy/available-programs/governors-house-program> It may be easier to search the internet for "South Dakota Governor's Homes."

Design assistance by SDREA

New Employee

West Central Electric is proud to announce the hiring of apprentice journeyman Brett Daly. He started his career with West Central on Oct. 14 and will work out of the Kadoka outpost.

Brett was raised in the Midland and Philip area. He graduated from Philip High School and then enrolled at Mitchell Technical College (MTC), where he graduated with a Power Line Construction and Maintenance diploma. Before employment with West Central, he drove truck and also worked on installing overhead fiber optics.

Becoming a lineman is an excellent career choice for Brett, as he has a head for heights. "I enjoy working at tall heights. Using the bucket truck is fun, and I really like climbing poles." He likes the wide-open spaces working in western South Dakota, specifically Kadoka, provides.

Brett comes from a ranch family and still helps his dad with that. "It's great that Kadoka is not too far from the ranch." He recently took up leatherworking and enjoys making belts and tack. Learning to play the guitar is another hobby he has taken up.

Brett and his wife, Haylee, are newlyweds. They married right before he started at West Central.

Welcome to West Central!

Snow Safety

There is no end to the terms for “really big snowstorm,” and those terms come in handy, particularly in America’s snowiest cities. Just check out these average annual snowfall totals in towns of at least 10,000 residents, according to the Farmer’s Almanac:

Sault Ste. Marie, Michigan – 119.3 inches
Syracuse, New York – 114.3 inches
Juneau, Alaska – 93.6 inches
Flagstaff, Arizona – 87.6 inches
Duluth, Minnesota – 83.5 inches
Erie, Pennsylvania – 80.9 inches
Burlington, Vermont – 80.2 inches
Muskegon, Michigan – 79.3 inches
Casper, Wyoming – 77 inches
Portland, Maine – 70 inches

But with really big snow storms – and even everyday, run-of-the-mill snowfalls – comes a risk of death by shoveling. Nationwide, snow shoveling is responsible for thousands of injuries and as many as 100 deaths each year.

So, why so many deaths? Shoveling snow is just another household chore, right?

Not really, says the American Heart Association. While most people won’t have a problem, shoveling snow can put some people at risk of heart attack. Sudden exertion, like moving hundreds of pounds of snow after being sedentary for several months, can put a big strain on the heart. Pushing a heavy snow blower also can cause injury.

And, there’s the cold factor. Cold weather can increase heart rate and blood pressure. It can make blood clot more easily and constrict arteries, which decreases blood supply. This is true even in healthy people. Individuals over the age of 40 or who are relatively inactive should be particularly careful.

National Safety Council recommends the following tips to shovel safely:

- Do not shovel after eating or while smoking.
- Take it slow and stretch out before you begin.
- Shovel only fresh, powdery snow; it’s lighter.
- Push the snow rather than lifting it.
- If you do lift it, use a small shovel or only partially fill the shovel.

- Lift with your legs, not your back.
- Do not work to the point of exhaustion.
- Know the signs of a heart attack, stop immediately and call 911 if you’re experiencing any of them; every minute counts.

Don’t pick up that shovel without a doctor’s permission if you have a history of heart disease. A clear driveway is not worth your life.

Snow Blower Safety

In addition to possible heart strain from pushing a heavy snow blower, stay safe with these tips:

- If the blower jams, turn it off.
- Keep your hands away from the moving parts.
- Be aware of the carbon monoxide risk of running a snow blower in an enclosed space.
- Add fuel outdoors, before starting, and never add fuel when it is running.
- Never leave it unattended when it is running.

“Don’t Cut the Power Lines!”

David Raak, Age 7 ½

David Raak cautions readers to be careful when working around power lines. Thank you for your picture, David! David’s parents are Nathaniel and Katie Raak, members of Central Electric.

Kids, send your drawing with an electrical safety tip to your local electric cooperative (address found on Page 3). If your poster is published, you’ll receive a prize. All entries must include your name, age, mailing address and the names of your parents. Colored drawings are encouraged.

Crockpot GREATNESS

CROCKPOT CORN

Ingredients:

3 16-oz. packages frozen corn
8 oz. cream cheese
1/2 cup (1 stick) butter
2 tbsps. sugar
2 tbsps. water

Method

Place corn in crockpot. Cut cream cheese and butter into small cubes. Add cream cheese, butter, sugar and water to corn. Stir. Cook on high for 45 minutes. Stir. Turn to low and cook for three more hours, stirring occasionally.

Elaine Rieck
Harrisburg, S.D.

CROCKPOT BAKED BEANS

Ingredients:

2 cans black beans
2 cans red beans (drained)
2 cans great northern
1 can baked beans with brown sugar
1 lb. diced ham
1 heaping tsp. mustard (regular)
2 full tbsps. ketchup
Garlic powder (optional)
1 small onion (chopped)

Method

Mix all ingredients in crockpot except ham. Cook 2 hours on high. Mix in ham and cook another hour on high. Enjoy!

Rose Tucker
Hot Springs, S.D.

CHICKEN FIESTA SLOW COOKER RECIPE

Ingredients:

2 lbs. boneless skinless chicken breasts
1 package slow cooker fiesta chicken seasoning mix
2 cans (14 1/2 oz. each) diced tomatoes, undrained
1 can (15 3/4 oz.) whole kernel corn, drained
1 can (15 oz.) black beans, drained and rinsed

Method

Place chicken in slow cooker. Mix seasoning, tomatoes, corn and beans until blended. Pour over chicken. Cover. Cook eight hours on LOW or four hours on HIGH. Remove chicken from slow cooker. Shred chicken, using two forks. Return chicken to slow cooker; mix well. Serve over cooked rice with assorted toppings, if desired.

McCormick.com

Please send your favorite recipes to your local electric cooperative (address found on Page 3). Each recipe printed will be entered into a drawing for a prize in December 2024. All entries must include your name, mailing address, phone number and cooperative name.

Uncover Savings With a DIY Energy Audit

Miranda Boutelle
Efficiency Services
Group

Q: How do I perform an energy audit on my home?

A: A home energy audit may sound daunting, but it can be as easy as creating a checklist of improvements based on what you see around your home.

Here's what you'll need to find opportunities to save energy and money: a flashlight, dust mask, tape measure and cooking thermometer. I recommend taking notes on your phone or a notepad.

First, check the heating and cooling equipment. Determine the age and efficiency of the equipment by looking up the model number on the nameplate. The average lifespan of HVAC equipment is 10 to 30 years, depending on the type of equipment and how well it's maintained. If your equipment is older, it may be time to budget for an upgrade. Check the filter and replace it if needed.

Then, check the envelope of your home, which separates the heated or cooled areas from the exterior, for drafts and air leakage. Feel around windows and trim for any drafts. Pay special attention to spots where different building materials come together. Check under sinks for gaps around pipes. Seal with weatherstripping, caulk or expanding foam as needed.

Make sure to replace incandescent or compact fluorescent bulbs with LEDs. LEDs use significantly less energy and last longer than traditional incandescent bulbs.

Check for leaking faucets and make sure aerators and showerheads are high-efficiency models in good condition. The gallons-per-minute (GPM) ratings should be etched onto them. To reduce wasted energy from using more hot water than needed, aerators should be 0.5 to 1.5 GPM, and showerheads should be no more than 2 GPM.

Next, look in the attic, while wearing a dust mask, to make sure it's insulated. You may be able to see

enough from the access area using a cellphone with the flash on to take pictures. Use the tape measure to check the depth of the insulation. It should be a minimum of 12 inches deep. This can vary depending on the type of insulation used and your geography.

Insulation can become compacted over time. It should be evenly distributed throughout the attic. Loose fill or blown-in insulation should be fluffy and evenly dispersed. Rolled batt insulation should fit tightly together without gaps.

Also, exterior walls should be insulated. If your home is older than the 1960s, the walls are probably not insulated. Homes from the 1960s or 1970s likely need more insulation. Sometimes you can see wall insulation by removing an outlet cover or switch plate and using a flashlight to look for insulation inside the wall cavity. Turn off the power at the electrical panel to avoid the risk of electric shock. Wall insulation can be blown in from the inside or the outside of the home. This is a job for a professional.

If you have a basement or crawlspace, head there next. Unfinished basements should have insulation on the rim joists, at minimum. This is the area between the top of the foundation and the underside of the home's first-story floor. Use closed-cell spray foam or a combination of rigid foam and spray foam to insulate rim joists. Crawlspace should have insulation on the underside of the floor between the floor joists. Insulation should be properly supported in contact with the floor with no air gaps. Water pipes and ductwork should also be insulated.

Lastly, check the temperature of your water by running it for three minutes at the faucet closest to your water heater. Then fill a cup and measure with a cooking thermometer. Hot water should be between 120 and 140 degrees. You can reduce the temperature on your water heater to reduce energy waste and prevent scalding.

Once your home energy audit is finished, review your findings and start prioritizing home energy efficiency projects. For step-by-step instructions, visit www.energy.gov/save.

When the Lights Turned On: Janet Gesinger Remembers the Days Before Power

Frank Turner
frank.turner@sdrea.coop

Memory is a fickle thing. It's funny how a certain smell or simple photo can evoke vivid memories of an age long past. After all, how can a memory be lost when we can't even remember losing it?

At the age of 89, Janet Gesinger doesn't remember the exact moment when Cam Wal Electric, her local rural electric cooperative, introduced electricity to her childhood farm and ranch 13 miles west of Gettysburg, but she does remember the days without it.

"It's amazing that I can remember some things from my childhood so vividly, but I couldn't tell you what I had for lunch last week," Gesinger laughed.

Gesinger remembers growing up on the farm during a time when the glow of kerosene lamps helped her family navigate the dark and a cistern well kept their food cool.

"I don't know how we could see with the little lamps, but we did," she said. "People were careful because they knew

what the risks were, carrying around those lamps."

At the age of 9, Gesinger and her three older siblings lost their mother. The profound loss meant that Gesinger had to step up to help her siblings and father keep the farm and ranch going.

"I ended up helping my dad outside more than I did anything inside the house," she said. "We lived in such a remote place. There weren't even gravel roads back then. If I ever wanted to leave the farm, I had to help my brother milk cows and do chores so he would take me into town."

In high school, Gesinger's horizons broadened past the farm, and she began working as a waitress at the Medicine Rock Café where she met her late husband, Robert Gesinger. A year later the couple married and moved to Robert's family farm and ranch just a few miles north of Ridgeview in 1954. The Ridgeview community gained power just one year earlier in 1953, and Janet continues to live there now as a member of Moreau-Grand Electric.

When Janet moved to Ridgeview it was a bustling, small town with a grain elevator, a grocery store with a post office in it, a liquor store, a school, and electricity. Today, nearly all those amenities are a distant memory, but the rural electricity that continues to power the homes of the roughly 25 residents of Ridgeview, including Janet, remains.

"Ridgeview had gotten electricity just before we got married," she said.

Once she lived in a home with electricity, Janet found it hard to imagine life without it. One winter storm in 2010 wreaked havoc on the rural landscape and broke more than 200 utility poles, leaving Robert and Janet without power for 21 days.

"By day three of the outage, we ended up getting a PTO driven generator that could hook up to the tractor," Janet said. "Robert was sure glad when the power came back on, because that way we didn't have to fuel the tractor twice a day to run it – and the cost of diesel to run it."

Reflecting on her experiences, Janet acknowledges the transformative impact of electricity on rural life and finds it hard to imagine a world without electricity.

"It's an amazing convenience that we rely on," Janet said. "People today couldn't live without it because what in the world would ever replace it? We have a lot of technology in this world, but there is nothing that can replace electricity."

PLANNING AHEAD

FORECASTING THE FUTURE

Basin Electric's Vision for Reliable Energy

Frank Turner

frank.turner@sdrea.coop

Keeping the lights on in a dynamic world isn't as simple as flipping a switch. It requires a forward-thinking approach, almost like gazing into a crystal ball, to anticipate future energy demand. Energy infrastructure projects begin long before the first shovel breaks ground, and it's a challenge that Basin Electric Power Cooperative confronts every day to ensure consistent and

reliable power amid an ever-changing landscape of new technologies and growing membership.

A new plant or transmission line can take years of planning and coordination by Basin Electric and its member cooperatives. The process is similar to predicting the weather; it all begins with a forecast to determine what energy demand is brewing on the horizon.

Basin Electric works with the members and other stakeholders to

develop highly accurate load forecasts. Those load forecasts are then compared against our existing resource portfolio. If any gaps are identified, resource alternatives are identified and reviewed against each other to arrive at the best resource portfolio outcome.

"Once a need for a new generation project or transmission project has been identified, Basin Electric assembles a project team," explained Matt Ehrman, vice president of engineering and construction at Basin Electric.

"Developing and defining project scope is vital to project success as it's really the foundation for the project," Ehrman continued. "Good upfront planning minimizes project execution

risks later, so Basin places a lot of emphasis on the development work that happens before any detailed engineering design can begin.”

Basin Electric is currently undertaking one of its largest single-site electric generation projects in the last 40 years near Williston, North Dakota, known as Pioneer Generation Station Phase IV. Once completed, this project will add 580 megawatts of natural gas generation capacity to Basin Electric’s energy portfolio. Although the project broke ground in March 2023, planning for the project began in 2021, standing as a testament to the cooperative’s long-term mindset and commitment to meeting its load forecast.

So what goes into the planning of such a major project? Ehrman says everything from identifying project objectives to permitting and contracting strategies to engineering studies all take place within the years leading up to new infrastructure.

“In the case of a generation project, the project site, fuel, water, and transmission sources are identified during the project development phase,” Ehrman said. “After the development phase is complete, the more detailed engineering design work can begin. This is when the engineers really begin to dig into the details of how to arrange and interconnect all of the many different types of equipment

The first gas turbine delivery for Pioneer Generation Station Phase IV. Photo submitted by Basin Electric Power Cooperative.

required for a given project. Eventually, those design details are used to develop construction specifications, contractors are selected and construction begins.”

Beyond the demanding complexity of the project itself, Basin Electric’s project team must also navigate regulatory matters and policy. While many projects share similarities, no two are identical when navigating federal, state, and local permitting requirements.

“Large generation and transmission projects can take years to permit, and the permitting duration depends on the project,” Ehrman said. “Basin’s

teams have successfully permitted and executed many projects over the years and as a result have learned a lot about those processes in our service territory.”

Slated to be operational in 2025, Pioneer Generation Station Phase IV will come on board during a time when electricity demand is increasing significantly. The completion of the project will expand Basin Electric’s resource portfolio, which uses a vast diversity of generation resources to serve its member cooperatives. Even still, Ehrman said it still takes a massive effort to stay prepared for what the future may bring.

“Planning and building energy infrastructure is a massive team effort that involves teams from Basin and its membership,” he said. “These are complex projects, and there are challenges involved in all phases of the projects. Basin has extremely talented, dedicated and hard-working teams developing these projects that really enjoy working out all the technical and non-technical details while mitigating risks to achieve success and deliver the best possible outcome for the membership.”

Early construction of the Pioneer Generation Station Phase IV. Photo submitted by Basin Electric Power Cooperative.

WCE Offers \$20,000 in Scholarships

What is the West Central Electric Scholarship Program?

The West Central Electric Cooperative Scholarship Program is a program developed and designed to encourage and recognize the academic achievements of the children of West Central Electric Cooperative members.

By recently increasing the scholarship amount, West Central will now give out **20 \$1,000** scholarships!

How may the scholarship be used?

The West Central Electric Scholarship program will award scholarships to students of rural electric cooperative members in five counties served by West Central Electric Cooperative.

The scholarships are for the 2025-2026 school year. The scholarships may be used for educational costs, housing, or educational materials. The student must enter College/Vocational School in the fall of the year in which the scholarship is given.

Who is eligible to receive the scholarship?

The applicant must be a U.S. Citizen and the natural or adopted child of a member of West Central Electric

Cooperative. The applicant must be a graduating high school senior who is enrolled or planning to enroll in full-time graduate or undergraduate course of study at an accredited two-year or four-year college, or university. One half of the scholarship moneys will be given to students who are enrolled or planning to enroll in an accredited vocational/technical school.

How are the recipients selected?

The scholarships are awarded on the following guidelines. Work experience, participation in school and community activities, a statement explaining his/her educational and career goals, SAT/ACT scores, and a written recommendation, by a third party, not someone associated with the education system. A short essay is also required. Applications without all the listed criteria will not be considered.

How can I apply?

To apply, you must provide the required criteria and a completed scholarship application, which can be obtained at your local high school, at the West Central Electric Cooperative headquarters in Murdo, S.D., or on our website at www.wce.coop/scholarship-program.

Applications should be returned to West Central Electric and must be received by **Feb. 14, 2025** to be eligible. The applicant is responsible for submitting all the necessary information for the scholarship. For further information, contact Jessie Tucker at 605-669-8100.

Products and Services Offered

For our cooperative members building a new home or updating your old heating system or water heater, West Central Electric has the following rebate programs for you to consider:

Electric Heat rebate

West Central will make a cash rebate of two (2) cents a watt for permanent installed 240-volt electric heat. Example: Install 10,000 watts of electric heat and receive a payment of \$200. Only consumers of West Central Electric Cooperative are eligible. Installation must be made at an account served by West Central Electric.

Electric Heat Pump Rebate

If the consumer installs a 15 SEER or 14.8 SEER 2 or greater heat pump, they will be entitled to a \$250 per ton rebate if installed in conjunction with electric heat. If more than one heat pump is installed, additional heat pumps will be paid at half price. Heat pumps installed with propane back up do not qualify.

SEER, or Seasonal Energy Efficiency Ratio, is most commonly used to measure the efficiency of a heat pump. The higher the SEER, the more efficient the system. The SEER rating is most often found on a yellow sticker attached to new units.

Electric Heat Program

WCEC's 3.8 cent per kilowatt-hour discount is among the best heating rates in the area. WCEC offers this discount for homes or businesses with separately metered electric heat. The heat program runs from October 1, until April 30, each heating season. Usually, your cooperative will supply all the necessary equipment at no charge. With West Central's low rate, electric heat is a safe, clean, economical way to heat your home.

Cove Heat Program

West Central Electric has for sale Comfort Cove electric heaters for any new load, new construction,

remodeling or to replace existing non-working electric heat. Following is our discounted pricing for members only:

Watts	Size	Price
450	34"	\$81
600	47"	\$106
750	59"	\$118
900	71"	\$133
1050	83"	\$145
1200	88"	\$158
1500	94"	\$168
1800	106 ¼"	\$189
2000	118 ¼"	\$203

Cove heaters are mounted on the wall, close to the ceiling, giving homeowners unrestricted use of floor space. Similar to the radiant heat from the sun, the heat goes to the floor and furnishings, which remain warmer than the air. Cove heat provides a greater comfort level as the room temperature from ceiling to floor is more even.

Marathon Water Heaters

For co-op members only West Central has three sizes of the energy efficient Marathon Water Heaters in stock at the following discounted prices:

Size	Member Cost
50 Gallon	\$775
85 Gallon	\$1,000
105 Gallon	\$1,075

To qualify for the discounted price, members must allow a load control Demand Response Unit (DRU) to be installed. West Central Electric's Load Management Program helps reduce the use of electricity during peak demand periods, thus helping to control electric rates.

Electric Grills

Great grilled flavor, no messy lighter fluid, no gas fumes or worries about running out of fuel. West Central Electric has on hand both large cart model and tabletop electric grills. The large cart model grill is priced \$150 and the tabletop model is \$130. Replacement elements are \$60.

For more information call 605-669-8100.

LOOKING AHEAD

An aerial view of the Wild Springs Solar Project near New Underwood, S.D. Photo submitted by East River Electric

Wind Energy Association Changes Name, Advocates For All Renewables

Jacob Boyko
jacob.boyko@sdrea.coop

The South Dakota Wind Energy Association is getting a fresh coat of paint this year with a rebrand that will expand the association’s advocacy mission to include more forms of renewable energy.

As solar energy generation in the state increases with new and upcoming projects, expanding the association — now called the South Dakota Renewable Energy Association — to include other forms of renewable energy and battery storage was the clear way forward according to association president and Sioux Valley Energy Director Gary Fish.

“The association started out as being very wind oriented, and that’s our legacy,” Fish explained. “But we also have somewhat migrated to having an energy portfolio where wind coexists

with coal, natural gas and solar, and that was the driver behind changing our name.”

The change comes in the wake of South Dakota’s first large-scale solar farm near New Underwood, which began commercial operation in March 2024. Basin Electric Power Cooperative will purchase 114 megawatts of the 128-megawatt renewable project.

The association began with the

leadership of East River Electric Power Cooperative in the mid-2000s as the generation and transmission co-op looked for ways to develop wind generation in the state to serve its growing member utilities and bring economic development and job opportunities to the state.

“Wind energy was at that time starting to become a more viable utility-scale source of power generation,” said Chris Studer, chief member and public relations officer at East River Electric.

A look on the ground as crews prepare the Wild Springs Solar Project for power generation. Photo submitted by East River Electric

“East River led an effort to build an association of stakeholders in South Dakota that can help advocate for the wind industry.”

It’s a mission that’s propelled South Dakota to being the state with the third highest renewable energy makeup, with more than 54% of in-state power generated from renewable wind and solar resources.

“We’ve gone from essentially zero wind energy to more than 3,000 megawatts of installed capacity in the state,” Studer said. “We have far surpassed what our original goal was.”

In the South Dakota Wind Energy Association’s initial stages, the board was composed mostly of utilities and developers focused on studying potential economic benefits and the infrastructure needs that come with increasing generation.

“I think everyone knew we had a great wind resource, but the real issue was having additional transmission to get the power out,” Fish said. “Could we build

the towers? Yes. Could we get the power to market? That was the challenge.”

As the association successfully made the case for wind energy, the membership grew to include other G&Ts and investor-owned utilities, landowner groups, turbine manufacturers, servicing companies and others from the wind energy supply chain.

One of the first large-scale renewable energy wins for the South Dakota Wind Energy Association and rural electric cooperatives was the 2011 commissioning of the 172-megawatt Crow Lake Project north of White Lake, South Dakota. The association membership helped support the launch of South Dakota Wind Partners to bring local residents an opportunity to invest in and own several turbines in the project.

According to East River Electric, the program generated about \$16 million worth of local investment.

“It was a very unique and successful

project that the South Dakota Wind Energy Association had involvement in and advocated for,” Studer said. “The people that invested got tax equity benefits over time, and after about 10 years they sold it back to Basin Electric and got their investments back.”

Moving forward, the association will continue to advocate for a renewable energy-friendly business environment to propel South Dakota energy projects forward.

“South Dakota Renewable Energy Association is here to make sure our state’s tax policies are fair, that developers still want to come here and develop renewable energy projects, and that there’s a market for all of the supply chain that’s needed for wind energy and now for solar, as well as the necessary transmission,” Studer continued.

A new South Dakota Renewable Energy Association website and promotional material will debut within the next several months.

The Crow Lake Wind Project near White Lake, S.D., is the largest wind project owned solely by a cooperative in the United States. The \$363 million wind project went into operation in 2011.
Photo submitted by East River Electric

RENEWABLE ENERGY

Purchasing Credits Means Renewable Energy Anywhere

Jacob Boyko

jacob.boyko@sdrea.coop

Did you know there's a way your home or business can operate with 100% renewable energy?

With renewable energy credits, or RECs, electric cooperative members can purchase the renewable aspects of their utility's energy and run on 100% green energy without needing to install on-site solar panels or wind generation.

"A REC is a renewable attribute of a megawatt hour of electricity," explained

Ted Smith, vice president of engineering and operations at Sioux Valley Energy. "One megawatt hour produced by any renewable generator provides one REC."

Basin Electric Power Cooperative – the generation and transmission cooperative that sells electricity to South Dakota's rural electric cooperatives – reported about 21% of its energy sales in 2023 was renewable energy. Since it's impossible to pinpoint the exact generation origin of each individual electron moving along a distribution line and entering a home or business, there's no way to tell what

is actually being powered by renewable energy and what isn't.

However, by having a renewable energy credit program where members can claim rights to the renewable energy generated, members who participate can affirm they are being powered by renewable energy. It's kind of like "calling dibs" on something; everybody is purchasing reliable power, but the members who "call dibs" are purchasing the renewable power.

One Sioux Valley Energy member that makes use of the renewable energy credit program is Marmen Energy in Brandon, South Dakota. Through the program, the wind tower manufacturer's operations are powered 100% by renewable energy.

"We get all renewable energy to power our facility," Marmen Energy Plant Manager Danny Lueders said. "We build renewable energy wind towers – how

could we not get the renewable energy credit program?”

At a scale like Marmen’s, which produces between 300 and 400 wind towers annually, being 100% renewable is a statistic that not only makes a statement, but increases demand for more renewable energy.

“It makes sense for us to have it and support that industry all the way through,” Lueders continued. “It’s an industry we’re heavily involved with and we want to do everything we can to support and promote that industry.”

Support for renewable energy through the REC program has other benefits; the extra funds Rushmore Electric Power Cooperative generated from selling allocated RECs made it possible to purchase a solar demonstration trailer to educate the public about the benefits and drawbacks of solar energy and the need for a diversified mix of energy resources.

“We sell the RECs on the open market so others can satisfy their renewable mandates and so we can fund future renewable energy projects,” Rushmore Electric CFO Mark Miller added.

On the market, RECs vary in price, usually between \$1 and \$3. The generation source – wind, solar, hydro, geothermal, waste heat recovery – as well as the year the REC’s production year affect the commodity’s value.

“They have a shelf life,” Miller explained. “They’re valuable in the first year because some states mandate RECs that are current.”

States like Minnesota with renewable energy standards require utilities to retire their RECs to meet the energy standards, or buy

credits on the market to reach the mandated renewable energy percentage of their energy mix.

In South Dakota, a state without renewable energy mandates but with more than 54% of in-state power generated by renewable resources, the Marmen Energy CEO simply believes continuing to support renewable energy is the right thing to do.

“South Dakota is a strong proponent of renewable energy,” Lueders said. “The amount of industry renewables are supporting throughout the state of South Dakota is a strong issue, from an economic footprint and continuing to grow South Dakota’s self-reliance on homemade energy.”

To have your event listed on this page, send complete information, including date, event, place and contact to your local electric cooperative. Include your name, address and daytime telephone number. Information must be submitted at least eight weeks prior to your event. Please call ahead to confirm date, time and location of event.

UNTIL DEC. 26
Christmas at the Capitol
8 a.m.-10 p.m.
Pierre, SD
605-773-3178

UNTIL DEC. 29
Trees & Trains Exhibit at SD State Railroad Museum
Hill City, SD
605-665-3636

UNTIL DEC. 31
Olde Tyme Christmas at participating businesses, Lane of Lights Viewing
Hill City, SD

UNTIL DEC. 31
Garden Glow at McCrory Gardens
5-9 p.m.
Brookings, SD

UNTIL DEC. 31
Hall of Trees
12-4 p.m. Mon.-Sat.
The Mead Museum
Yankton, SD

DEC. 31
American Legion Post 15 Save the Last Dance 2024
8 p.m.-12:30 a.m.
El Riad Shrine
Sioux Falls, SD
605-336-3470

DEC. 31-JAN. 1
New Year's Eve in Deadwood
Deadwood, SD
800-999-1876

JAN. 5, FEB. 2
American Legion Post 15 Pancake Breakfast
8:30 a.m.-12 p.m.
1600 W. Russel St.
Sioux Falls, SD
